The closest prior art to the present invention is Miller et al. (U. Patent No. 4,506,348). Miller et al. disclosed a variable digital delay circuit which utilizes a shift register to periodically sample a signal to be delayed and after a predetermined number of samples are collected as a group of zeroes and ones making up a binary word. Miller et al. failed to show or suggest the combination of a register to store a value and a plurality of input receivers that includes input receivers to sample operation code synchronously with respect to an external clock signal wherein in response to a second operation code, the memory device samples write data corresponding to the write operation at a time determined using a value stored in the register.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
